

The field of urology is covering a wide range of medical disorders including oncology, functional impairments of the bladder, urolithiasis, and andrology. Being a relatively small specialty renders multidisciplinary treatments as core of daily practice. The technological developments have reshape the profession profoundly with the introduction of endosurgical and robotsurgery. In addition imaging options allow improved staging to better tailor treatment and counsel patients. Urology is involved in treatment of 3 of the top 10 oncological diseases worldwide. The continuous technical developments require rapid adaptation of training and clinical practice. In the presentation we will highlight on the main workload of urologists and present the interaction with other specialties as well as the challenges for training.
