

## **Corner Session: The potential of functional hazardous anticancer drug labels**

**Presenter: Atsushi Hironaga**

According to the literature, the occupational risk of long-term exposure to chemotherapy drugs has been documented in many studies over the last 40 years. Occupational exposure to HDs has been expressed by reports and studies of adverse effects on healthcare workers. Several factors have contributed to the risk increase. Many studies have demonstrated that the outer surfaces of the vials that contain these drugs are often contaminated with the drugs. IL Group introduces VPP (Vial Protect Pack) with Shrink Tack Label as one of the solutions to the strategies of contamination on the exterior surface of vials with scientific data.
